Quiz Information

Question 1 (2 points)

Consider an input color image of size $M \times N \times nC = 64 \times 64 \times 3$ is to be processed by a convolutional layer with $nF = 8$ filters and a filter size of $F1 \times F2 = 5 \times 5$. Given the dilation factor D is 4, the stride S is 1, and the padding size P is 1 in each of the two directions of the filter. Show in your Answer Book the step-by-step calculation of the total number of neurons in the output of the convolutional layer (requiring the number of neurons calculated in each direction to be rounded to the nearest integer towards minus infinity). Submit the total number of neurons by typing Your Answer in the Answer box below the question and attach your Answer Book to support your work.
